

**Amendment to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (currently amended): A content control method for controlling a process on a receiving side apparatus which is applied to content comprising a plurality of blocks transmitted from a transmitting side apparatus to the receiving side apparatus, comprising the steps of:

adding first control information to ~~a block~~ one or more blocks of the content transmitted from the transmitting side apparatus[,] to the receiving side apparatus,

wherein said first control information specifies conditions ~~to permit for~~ permitting processes to be applied to ~~the block~~ said one or more blocks of the content, and

wherein the content including the first control information is stored in a first location of the receiving side apparatus;

receiving a process designation ~~concerning~~ corresponding to the content transmitted from the transmitting side apparatus to the receiving side apparatus,

wherein second control information is stored in a second location of the receiving side apparatus, which receives the content transmitted from the transmitting side apparatus, and

wherein said second control information ~~specifying~~ specifies conditions ~~to~~ apply for applying processes to the content; and

if [the] a condition specified by the second control information satisfies [the] a condition corresponding to the process designation specified by the first control information, applying ~~the process~~ a process corresponding to the process designation to the received ~~block~~ said one or more blocks of the content.

2. (currently amended): A contents control method according to claim 1, wherein as the process corresponding to the process designation, reproduction of ~~the content~~ said one or more blocks, copy of ~~the content~~ said one or more blocks, storage in a non-processible area, storage in a processible area, display of attendant data accompanying ~~the content~~ said one or more blocks, selection of an apparatus for transmission of ~~the content~~ said one or more blocks, or bi-directional communication between the transmitting side apparatus and the receiving side apparatus is carried out.

3. (currently amended): A contents control method according to claim 2, wherein ~~the block~~ said one or more blocks of the content has an area to which control needed/unneeded information indicative of need/non-need for control of the content is added, and in case that the control needed/unneeded information indicates "need for control", the step of adding the first control information is performed.

4. (previously presented): A contents control method according to claim 3, said control needed/unneeded information is falsification detection needed/unneeded information indicative of need/non-need for detection of a falsification of the content,

and said first control information is falsification detection information for performing the falsification detecting.

5. (currently amended): A contents control method according to claim 4 further comprising[.];

detecting illegality to the received content on the receiving side apparatus[.];

and

in case that illegality is detected, a step of stopping the process corresponding to the process designation and applied to the block of the content, and notifying information concerning the illegality to the transmitting side apparatus or a third party.

6. (currently amended): A contents control method according to claim 5, wherein in case that the condition specified by the second control information to apply the process corresponding to the process designation to the content ~~satisfies~~ does not satisfy the condition specified by the first control information to permit the process corresponding to the process designation, in case that a falsification of the content is detected by the falsification detection needed/unneeded information and the falsification detection information added to the received content, or in case that modification or loss of the first control information added to the content or the second control information stored in the receiving side apparatus are detected, detection of illegality is determined on the receiving side apparatus.

7. (previously presented): A contents control method according to claim 6, wherein the information to be notified includes any one or more of pieces of information concerning the falsification of the content, the modification of the first control information, the modification of the second control information stored in the receiving side apparatus, the received process designation, the content, transmitting side apparatus, and receiving side apparatus.

8. (currently amended): A contents control method according to claim 7 further comprising the steps of:

adding history information indicative of the process substance applied to the block said one or more blocks of the content;

re-transmitting the content with the history information from the receiving side apparatus to ~~either~~ a second receiving side apparatus; and

in case of the history information contradictory to conditions of the first control information added to the re-transmitted content ~~re-transmitted from the receiving side apparatus to the other receiving side apparatus~~, stopping the process applied to the block of the re-transmitted content ~~which is re-transmitted from the receiving side apparatus~~, and notifying information concerning the process which includes any one or more of pieces of information concerning the content, the transmitting side apparatus and the receiving side apparatus which re-transmits the content, to the transmitting second receiving side apparatus which receives the re-transmitted content or the third party.

9. (currently amended): A content control system for controlling a process on a receiving side apparatus which is applied to contents transmitted from a transmitting side apparatus to the receiving side apparatus, comprising:

a control information adding processor for adding first control information to a ~~block~~ one or more blocks of a content transmitted from the transmitting side apparatus to the receiving side apparatus,

wherein said first control information specifies conditions ~~to permit for~~ permitting processes to be applied to ~~the block~~ said one or more blocks of the content, and

wherein the content including the first control information is stored in a first location of the receiving side apparatus;

a process designation reception processor for receiving a process designation corresponding to the content transmitted from the transmitting side apparatus to the receiving side apparatus,

wherein second control information is stored in the receiving side apparatus which receives the content transmitted from the transmitting side apparatus, and

wherein said second control information specifies conditions ~~to apply for~~ applying processes to the content; and

a contents control processor for applying ~~the process~~ a process corresponding to the process designation to the received ~~block~~ one or more blocks of the content, if [the] a condition specified by the second control information satisfies [the] a condition corresponding to the process designation specified by the first control information.

10. (previously presented): A contents control system according to claim 9, wherein the contents control processor performs, as the process corresponding to the process designation, reproduction of the content, copy of the content, storage in a non-processible area, storage in a processible area, display of attendant data accompanying the content, selection of an apparatus for transmission of the content, or bi-directional communication between the transmitting side and the receiving side.

11. (currently amended): A contents control system according to claim 10 further comprising:

a falsification detection information adding processor for adding falsification detection needed/unneeded information and falsification detection information for performing the falsification detection to the block, wherein the block of the content transmitted from the transmitting side apparatus to the receiving side apparatus has an area to which the falsification detection needed/unneeded information indicative of need/non-need for falsification detection of the content is added; and

a falsification detection processor for stopping, in case that a falsification of the content is detected by the falsification detection needed/unneeded information and the falsification detection information added to the content transmitted from the transmitting side apparatus to the receiving side apparatus apparatus, the process corresponding to the process designation and applied to the block of the content, and transmitting information concerning the falsification to the transmitting side apparatus or a third party.

12. (previously presented): A contents control system according to claim 11, wherein history information indicative of the process substance applied to the content is added to the content, and in case of the history information contradictory to the conditions of the first control information, the process applied to the block of the content is stopped and information concerning the process is transmitted to the transmitting side apparatus or the third party.

13. (currently amended): A content transmitting apparatus for transmitting content from a transmitting side apparatus to a receiving side apparatus, comprising:  
a content reading processor for reading ~~a block~~ one or more blocks of a content transmitted from the transmitting side apparatus to the receiving side apparatus;

a control information adding processor for adding first control information to ~~the block~~ said one or more blocks of the content transmitted from the transmitting side apparatus to the receiving side apparatus,

wherein said first control information specifies conditions ~~to permit for~~ permitting processes to be applied to ~~the block~~ said one or more blocks of the content, and

wherein the content including the first control information is stored in a first location of the receiving side apparatus; and

a content transmitting processor for transmitting the block of the content from the transmitting side apparatus to the receiving side apparatus,

wherein a second location of said receiving side apparatus holds second control information for specifying conditions ~~to apply for~~ applying processes to the

content so that [the] a process corresponding to a process designation received by the receiving side apparatus is applied to ~~the block~~ said one or more blocks of the content, if [the] a condition specified by the second control information satisfies [the] a condition corresponding to the process designation specified by the first control information.

14. (previously presented): A contents transmitting apparatus according to claim 13, wherein the first control information is information for reproduction of the content, copy of the content, storage in a non-processible area, storage in a processible area, display of attendant data accompanying the content, selection of an apparatus for transmission of the content, or control of bi-directional communication between the transmitting side apparatus and the receiving side apparatus.

15. (previously presented): A contents transmitting apparatus according to claim 14 further comprising a falsification detection information adding processor for adding falsification detection needed/unneeded information indicative of need/non-need for falsification detection of the content and falsification detection information for performing the falsification detection to the block of the content transmitted from the transmitting side apparatus to the receiving side apparatus.

16. (currently amended): A content receiving apparatus for receiving content transmitted from a transmitting side apparatus to a receiving side apparatus, comprising:

a process designation reception processor for receiving a process designation ~~concerning~~ corresponding to the content transmitted from the transmitting side apparatus to the receiving side apparatus;

a content receipt processor for receiving ~~a block~~ one or more blocks of the content transmitted from the transmitting side apparatus to the receiving side apparatus,

wherein first control information for specifying conditions ~~to permit for~~ permitting a process to be applied to ~~the block~~ said one or more blocks of the content is added to the block of the content,

wherein the content including the first control information is stored in a first location of the receiving side apparatus, and

wherein second control information for specifying conditions ~~to apply for~~ applying a process to the content is stored in a second location of the receiving side apparatus; and

a content control processor for applying a process corresponding to the received process designation, the process corresponding to the process designation [to] of the received ~~block~~ one or more blocks, if the condition specified by the second control information satisfies the condition corresponding to the process designation specified by the first control information.

17. (currently amended): A contents content receiving apparatus according to claim 16, wherein as the process corresponding to the process designation, reproduction of the content, copy of the content, storage in a non-processible area, storage in a processible area, display of attendant data accompanying the content,

selection of an apparatus for transmission of the content, or bi-direction communication between the transmitting side apparatus and the receiving side apparatus is carried out.

18. (currently amended): A ~~contents~~ content receiving apparatus according to claim 17 further comprising a falsification detection processor for stopping, in case that a falsification of the content is detected by falsification detection needed/unneeded information and falsification detection information added to the content transmitted from the transmitting side apparatus to the receiving side apparatus, the process corresponding to the process designation and applied to the contents, and transmitting information concerning the falsification to the transmitting side apparatus or a third party.

19. (currently amended): A content ~~contents~~ receiving apparatus according to claim 18, wherein history information indicative of the process substance applied to the content is added to the content, and in case of the history information contradictory to conditions of the first control information added to the content transmitted from the transmitting side apparatus to the receiving side apparatus, the process to the content is stopped and information concerning the process is transmitted to the transmitting side apparatus or the third party.

20. (currently amended): A computer program product having computer readable instruction code on a computer usable medium, comprising:

instruction for reading ~~a block~~ one or more blocks of [the] content transmitted from the computer to a receiving side apparatus;

~~instructions~~ instruction for adding first control information to ~~the block~~ said one or more blocks of the content,

wherein said first control information specifies conditions ~~to permit~~ for permitting processes to be applied to the content, and

wherein the content including the first control information is stored in a first location of the receiving side apparatus; and

instruction for transmitting ~~the block~~ said one or more blocks of the content from the computer to the receiving side apparatus,

wherein a second location of said receiving side apparatus holds second control information for specifying conditions ~~to apply~~ for applying processes to the content so that [the] a process corresponding to a process designation received by the receiving side apparatus is applied to ~~the block~~ said one or more blocks of the content if [the] a condition specified by the second control information satisfies ~~the condition~~ a condition corresponding to the process designation specified by the first control information.

21. (currently amended): The computer program product according to claim 20, wherein ~~the block~~ said one or more blocks of the content transmitted from the computer to the receiving side apparatus has an area to which falsification detection needed/unneeded information indicative of need/non-need for falsification detection of the content is added, ~~function~~ further comprising:

instruction for adding the falsification detection needed/unneeded information and falsification detection information for performing the falsification detection to the block of the content.

22. (currently amended): A computer program product having computer readable instruction code on a computer usable medium, comprising:

instruction for receiving a process designation concerning [the] content transmitted from a transmitting side apparatus to the computer;

instruction for receiving ~~a block~~ one or more blocks of the content transmitted from the transmitting side apparatus to a first location of the computer,

wherein ~~the block~~ said one or more blocks includes first control information for specifying conditions ~~to permit~~ for permitting processes to be applied to the content, and

wherein the computer stores second control information for specifying conditions ~~to apply for~~ applying processes to the content in a second location; and

~~corresponding to the received process designation, the instruction for applying~~  
a process corresponding to the process designation to the received block one or more blocks of the content, if [the] a condition specified by the second control information satisfies [the] a condition specified corresponding to the process designation by the first control information.

23. (previously presented): The computer program product according to claim 22, further comprising:

instruction for stopping, in case that a falsification of the content is detected by falsification detection needed/unneeded information and falsification detection information added to the content transmitted from the transmitting side apparatus to the computer, the process corresponding to the process designation and applied to

the content, and transmitting information concerning the falsification to the transmitting side apparatus or a third party.

24. (previously presented): The computer program product according to claim 23, wherein history information indicative of the process substance applied to the content is added to the content, further comprising:

in case of the history information contradictory to the conditions of the first control information added to the content transmitted from the transmitting side apparatus to the computer, instruction for stopping the process applied to the content and transmitting information concerning the process to the transmitting side apparatus or the third party.

25. (previously presented): A contents control method according to claim 1, wherein the second information stored in the receiving side apparatus is information acquired by the receiving side apparatus from the transmitting side apparatus or a third party.

26. (previously presented): A contents control method according to claim 25, wherein the information acquired by the receiving side apparatus is information acquired concomitantly with authentication with the transmitting side apparatus or the third party.
